

The web is evolving...

Web 2.0 Services

Rich Internet Application Development Services

When one steps back from the rumbling and cuts through the hype often surrounding web 2.0 technology, innovative ideas emerge. In these moments of clarity, one sees beyond the difficulties and discovers untapped opportunities.

At ecom enterprises we pride ourselves on "discovering" new opportunities for our clients. Our unique approach to eBusiness can help your company see beyond the technical jargon and hype of today's marketplace to a clear path of opportunity. Whether it's creating a dynamic on-line presence, exploring the opportunities with web 2.0 or leveraging the capabilities of a customized intranet application, ecom enterprises has "real-world" solutions that can unlock the doors of opportunity for your company.

A few of the web development services we offer:

- Rich Internet Applications
- Product Configuration Tools
- Web-Based Application Interfaces
- Database Driven Applications
- Mobile Applications
- Intranet & Extranet Applications
- Custom E-Commerce Applications
- Content Management Applications
- B2B/B2C Custom Applications

Our Services

Rich Internet Application Development

The next generation of web application development is here. Rich Internet Applications or RIAs are part of the latest advancement in internet technology, known as Web 2.0, that allow web based applications to act more like desktop applications; they're faster, easier to use and don't require the constant page submits associated with current internet based applications. The cutting edge technology of RIAs is the future of the web.

Ecom enterprises is a leading rich internet application and Flex solutions provider. From re-architecting existing enterprise level

applications to building new robust rich internet applications, ecom enterprises has designed, developed and delivered some of the most innovative and comprehensive RIA solutions on the web today.

Whether it's being built using our award winning eTechnology code libraries or being designed from scratch, the custom RIA we build for your company will benefit from years of experience and "real-world", firsthand knowledge. Our commitment to excellence ensures your rich internet application will deliver an effective solution to your growing business needs.

Database Driven Application Development

What is a "database driven" web application? Simply put, a dynamically driven web application uses a database to store its content (text, media, press releases, etc.). This content is then pulled from the database via an application server such as ColdFusion, ASP or Java and converted into a web page "on-the-fly". Dynamic, database-driven web applications allow for numerous possibilities. Content Management systems, Inventory Tracking, Order Processing, Product Cataloging and Data Mining are just a few.

More than 98% of the web applications built by ecom enterprises are dynamic, database-driven applications. This in-depth knowledge and experience gives ecom enterprises a distinct advantage when it comes to developing dynamic database-driven solutions. Whether it's being built from our award winning eTechnology code library or being

designed from scratch, the application we build for your company will benefit from years of experience and "real-world", firsthand knowledge.

Our commitment to excellence ensures your database-driven application will deliver a complete on-line experience-- one that can be measured in performance, efficiency and a clear ROI.

E-Commerce Application Development

Having built more e-commerce applications than we can count, electronic commerce has become our specialty. From simple one-page event registration forms to fully automated, 500,000-plus product inventories, ecom enterprises has delivered some of the most innovative and comprehensive e-commerce sites around.

This in-depth knowledge of electronic commerce gives ecom enterprises a distinct advantage when it comes to developing e-commerce solutions. Whether it's being built from our award winning eMart code library or being designed from scratch, the e-commerce application we build for your company will benefit from years of experience and "real-world", firsthand knowledge.

Intranet/Extranet/Portal Application Development

The Internet can be an amazing tool to increase communication, coordinate corporate departments or processes, reach new audiences, analyze and expose data or simply to relate new information. Business managers looking to gain economies of scale or create new organizational efficiencies have found Intranet, Extranet and Portal applications to be the perfect solution.

ecom enterprises has extensive knowledge in developing Intranet, Extranet and Portal applications. From HP's Global RiskWeb Intranet to Digidesign's DigiProNet Pro-Audio Portal, ecom enterprises has been taking business ideas and flushing them out into cutting edge eBusiness applications and removing the physical boundaries of what it means to be a global company.

Proven Methodology

The key to ecom enterprises' success has been process. Knowing how to initiate the discussion, coordinate key stake-holders opinions, prioritize objectives and develop work specifications during the discovery process, are some of the many considerations made when we approach a new task. Our detailed 15-step Work Plan ensures every project is well thought out and smoothly executed. Following the development tasks is a two-stage quality assurance testing process that include internal and external alpha and beta testing. Additionally, ecom enterprises offers ongoing training, maintenance and support to ensure your company receives a maximum return on your investment.
